Forecasting Fundamentals - Nada Sanders 2016-11-14

This book is for everyone who wants to make better forecasts. It is not about mathematics and statistics. It is about following a well-established forecasting process to create and implement good forecasts. This is true whether you are forecasting global markets, sales of SKUs, competitive strategy, or market disruptions. Today, most forecasts are generated using software. However, no amount of technology and statistics can compensate for a poor forecasting process. Forecasting is not just about generating a number. Forecasters need to understand the problems they are trying to solve. They also need to follow a process that is justifiable to other parties and be implemented in practice. This is what the book is about. Accurate forecasts are essential for predicting demand, identifying new market opportunities, forecasting risks, disruptions, innovation, competition, market growth and trends. Companies can navigate this daunting landscape and improve their forecasts by following some well-established principles. This book is written to provide the fundamentals business leaders need in order to make good forecasts. These fundamentals hold true regardless of what is being forecast and what technology is being used. It provides the basic foundational principles all companies need to achieve competitive forecast accuracy.

Introduction to Time Series and Forecasting - Peter J. Brockwell 2013-03-14

Some of the key mathematical results are stated without proof in order to make the underlying theory accessible to a wider audience. The book assumes a knowledge only of basic calculus, matrix algebra, and elementary statistics. The emphasis is on methods and the analysis of data sets. The logic and tools of model-building for stationary and non-stationary time series are developed in detail and numerous exercises, many of which make use of the included computer package, provide the reader with ample opportunity to develop skills in this area. The core of the book covers stationary processes, ARMA and ARIMA processes, multivariate time series and state-space models, with an optional chapter on spectral analysis. Additional topics include harmonic regression, the Burg and Hannan-Rissanen algorithms, unit roots, regression with ARMA errors, structural models, the EM algorithm, generalized state-space models with applications to time series of count data, exponential smoothing, the Holt-Winters and ARAR forecasting algorithms, transfer function models and intervention analysis. Brief introductions are also given to cointegration and to non-linear, continuous-time and long-memory models. The time series package included in the back of the book is a slightly modified version of the package ITSM, published separately as ITSM for Windows, by Springer-Verlag, 1994. It does not handle such large data sets as ITSM for Windows, but like the latter, runs on IBM-PC compatible computers under either DOS or Windows (version 3.1 or later). The programs are all menu-driven so that the reader can immediately apply the techniques in the book to time series data, with a minimal investment of time in the computational and algorithmic aspects of the analysis.

The Elements of Statistical Learning - Trevor Hastie 2013-11-11

During the past decade there has been an explosion in computation and information technology. With it have come vast amounts of data in a variety of fields such as medicine, biology, finance, and marketing. The challenge of understanding these data has led to the development of new tools in the field of statistics, and spawned new areas such as data mining, machine learning, and bioinformatics. Many of these tools have common underpinnings but are often expressed with different terminology. This book describes the important ideas in these areas in a common conceptual framework. While the approach is statistical, the emphasis is on concepts rather than mathematics. Many examples are given, with a liberal use of color graphics. It should be a valuable resource for statisticians and anyone interested in data mining in science or industry. The book's coverage is broad, from supervised learning (prediction) to unsupervised learning. The many topics include neural networks, support vector machines, classification trees and boosting---the first comprehensive treatment of this topic in any book. This major new edition features many topics not covered in the original, including graphical models, random forests, ensemble methods, least angle regression & path algorithms for the lasso, non-negative matrix factorization, and spectral clustering. There is also a chapter on methods for "wide" data (p bigger than n), including multiple testing and false discovery rates. Trevor Hastie, Robert Tibshirani, and Jerome Friedman are professors of statistics at Stanford University. They are prominent researchers in this area: Hastie and Tibshirani developed generalized additive models and wrote a popular book of that title. Hastie co-developed much of the statistical modeling software and environment in R/S-PLUS and invented principal curves and surfaces. Tibshirani proposed the lasso and is co-author of the very successful An Introduction to the Bootstrap. Friedman is the co-inventor of many data-mining tools including CART, MARS, projection pursuit and gradient boosting.

Generational Dynamics Anniversary Edition: Forecasting America's Destiny - John J. Xenakis 2019-12

This book is a 2020 reprint of the classic 2004 book that launched generational theory and Generational Dynamics. In addition to the complete original text, forty pages of new material have been added, describing how generational theory has evolved and developed between 2004 and 2020. Technically, Generational Dynamics combines Chaos Theory with MIT's System Dynamics applied to generational flows. Chaos theory tells you what can and cannot be predicted, and System Dynamics tells you how to predict it. Since publication of the original book, the GenerationalDynamics.com web site contains thousands of articles, forecasts and predictions for hundreds of countries throughout history, and into the future. All of these predictions have turned out to be true or are trending true. None has been proven wrong. This book introduces the "Principle of Localization," which says that generational theory applies to each local nation or society. It gives fascinating details about many specific crisis wars, such as King Philip's war, World Wars I and II, Napoleon's invasion of Russia, the Peloponnesian War, Bolshevik Revolution, Taiping Rebellion, and so forth. Generational theory is also integrated with financial and technological forecasting, to show how they interact, and how to predict major financial crises. Recent books in the Generational Theory Book Series by the same author include "World View: War Between China and Japan: Why America Must Be Prepared" and "World View: Iran's Struggle for Supremacy -- Tehran's Obsession to Redraw the Map of the Middle East." These books analyze millennia of history for China and Iran, respectively, and predict each country's future in view of its past. The new introduction includes the history and evolution of the original Fourth Turning theory by Bill Strauss and Neil Strauss, which focuses on popular American generational sociology (Millennials, etc.)
